Crop protection :: IPM :: Grapes

Integrated pest management of grapes

- The integration of various control strategies can be effectively manage the pest faunal complex of grapes

Cultural

- Removal of bark of the vine after pruning results in reducing the flea beetle adult population by way of disturbing their ovipositional sites
- Light trap should also be used to trap adult chafers to minimize foliar damage

Biological

- Release of coccinellid predator like *Cryptolaemus montrouzieri* is effective for reducing meal bug colonies in vineyards
